

IPLCheck

NewEra Software, Inc.

We're all geared up to help you reduce costs and improve z/OS integrity.

The IBM Health Checker for z/OS now plays a central role in the implementation of z/OS system control strategies. Correctly applied, these strategies offer you a management blueprint designed to reduce the Total Cost of Ownership (TCO) of the zEnterprise, while at the same time improving z/OS system availability and compliance.

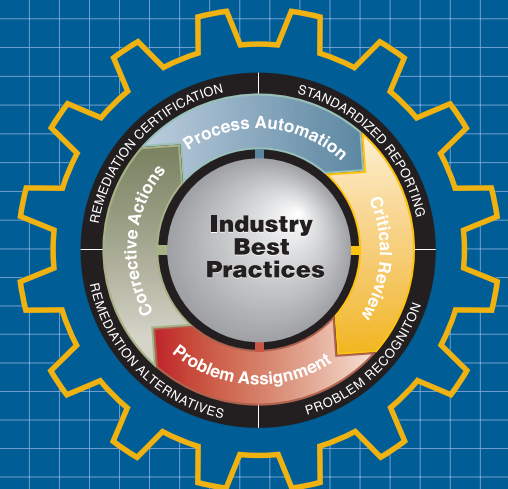

Know that it's available free on every z/OS LPAR.

Free or not, it's the expected results that should compel you to implement and exploit this remarkable z/OS system monitoring environment. Here are just a few key benefits you'll appreciate:

- **Open Framework** – Allows IBM Groups and 3rd Party Vendors to easily support and add new application objects called "Health Checks".
- **Standards Based** – Each Check supports a core set of z/OS best practices, detecting deviations as they arise and reporting them as directed.
- **Structured Reporting** – Well-behaved Checks enforce notification and reporting guidelines that ensure immediate problem identification accompanied with appropriate recommended remediation.

Make your strategy even stronger with IPLCheck.

Predictive Failure Analysis (PFA)

What is IPLCheck?

IPLCheck is an integrated set of Predictive Failure Analysis (PFA) "Health Checks" that evaluate z/OS configuration settings against 'Industry Best Practices' to pinpoint the causes of potential system initialization failures.

- **IPLCheck-Core** is directed to automatically discover the IPL PARMs of each 'Production' z/OS LPAR to which it is assigned. It evaluates running settings for syntax and related system components for structural integrity.
- **IPLCheck-Plus** is directed to 'Alternate' z/OS LPARs via user-managed settings that override IPLCheck-Core discoveries. Alternates include Unit Address, LoadParm, Catalog and development IPLPARM and PARMLIB datasets.
- **IPLCheck-Dynamic** evaluates LPALST, LNLKST, APFLST and SYMLST settings. Mismatches with 'Actual' production or alternate configurations often result in a loss of functionality when an LPAR is re-IPLed.
- **IPLCheck-Subsystems** extends the discovery and standards enforcement found in IPLCheck-Core and IPLCheck-Plus to include the z/OS subsystems JES, VTAM, CICS and various TCP/IP components.

IPLCheck findings – potential failures – are reported to the Health Checker Framework where they are immediately distributed to operational and technical staff for review and remediation. A detailed review of all LPARs can be conducted simultaneously using the IPLCheck-Viewer.

How do I get access to IPLCheck?

IPLCheck is an integral part of the Image Control Environment (ICE). ICE is a simple Web download that you move to a z/OS mainframe and install. To establish a download link to your personal copy, send your CPU Model and Serial Numbers via Email to support@newera.com using the subject 'IPLCheck Download'. We will reply promptly and you will be on your way.
